

# React Hooks & State Management

## Study Notes

### 1. Introduction to React Hooks

React Hooks are functions that let you use state and other React features in functional components. They were introduced in React 16.8.

### 2. Key Hooks Overview

`useState`: Manages state in functional components

`useEffect`: Handles side effects like API calls

`useContext`: Accesses context values

`useReducer`: Complex state management

`useCallback`: Memoizes functions

`useMemo`: Memoizes values

### 3. `useState` Hook

```
const [count, setCount] = useState(0);
```

This hook takes an initial value and returns an array with the state and a function to update it.
