

React Hooks Study Guide

1. Introduction to Hooks

Hooks are functions that let you use state and other React features in functional components. They were introduced in React 16.8.

2. useState Hook

The useState hook allows you to add state to functional components. It returns an array with two elements: the state value and a function to update it.

3. useEffect Hook

useEffect performs side effects in functional components. It runs after every render by default. You can specify dependencies to control when it runs.

4. Custom Hooks

Custom hooks are functions that use other hooks. They allow you to reuse stateful logic between components. Names should start with "use".

5. Rules of Hooks

- Only call hooks at the top level
- Never call hooks inside loops, conditions, or nested functions
- Only call hooks from React function components
